receiving, on the average, about two-fifths of the normal quantity; but it had received little rain during May.

In the entire country the greatest monthly amount reported was 25.34 inches, at Miami, Fla. In the portion west of the Mississippi River, the greatest measurement was 13.49 inches, at a station in Iowa.

### SUNSHINE AND RELATIVE HUMIDITY

Much cloudy weather prevailed in the South Atlantic States, especially in the Florida peninsula, the south-eastern portion of which received less than 20 per cent. of possible sunshine for the month. Likewise, much of the New England States, the northern portion of the Lake

region, and the far Northwest received relatively small amounts of sunshine. On the other hand, from the Ohio and middle Mississippi Valleys to the Gulf and westward to the Pacific, except a small area in southern California, most localities received more than 70 per cent of sunshine, while the southwestern portions of Arizona and Nevada, and southeastern California received from 90 to 96 per cent of the possible amount for the month. The relative humidity, as would be expected, was generally below the normal over most sections of the country, except in New England, the lower South Atlantic States, some portions of the Lake region, and a few scattered localities in the central and western regions, where the humidity was somewhat above the average for the month.

## SEVERE LOCAL STORMS, JUNE, 1930

[The table herewith contains such data as have been received concerning severe local storms that occurred during the month. A more complete statement will appear in the Annual Report of the Chief of Bureau]

		<del>,</del>	I	1	1	1			
Place	Date	Time	Width of path (yards) 1	Loss of life	Value of property destroyed	Character of storm	Remarks	Authority	_

### RIVERS AND FLOODS

By R. E. SPENCER

In the May, 1930, issue of this Review it was stated that the only important damage done by the Arkansas and White River rises of that month was to prospective crops. A belated report of losses resulting from these floods gives the complete figures as follows:

	Black and White Rivers	Arkansas River
Tangible property	\$10,000 8,500 10	\$1, 150 35, 000
Suspension of business  Total reported loss.  Value of property saved through Weather Bureau warnings.	56, 25,	

Effects of the flood continuing from May in the Tallahatchie Basin appear in the table below. The overflow data are drawn largely from the results of a survey made by the Vicksburg, Miss., office of the Mississippi River Commission. No loss of life, or livestock or other movable property was reported.

	}	Losses								
County	Acres over- flowed	Planting (actual loss)	Crops (prospec- tive value)	High- ways	Build- ings	Land	Levees			
	1050	G-44- 41 400

i Improved land.

Relative to the flood in the Skunk, Des Moines, and Mississippi Rivers, the official in charge of the Weather Bureau office at Hannibal, Mo., reports as follows:

Excessively heavy rains in the Des Moines and Skunk Valleys in Iowa, on June 14 and 15, caused a severe flood in the Skunk River and slight flood conditions in the lower Des Moines, and the Mississippi as far south as Louisiana, Mo. The Skunk River was the highest ever known at Augusta, and the damage to growing crops was considerable. In the Des Moines and Mississippi Valleys the damage was not heavy heavy heaving head limited to the destruction the damage was not heavy, having been limited to the destruction of some small areas of crops in the low bottom lands and outside levees. All livestock had to be moved from island pastures.

Losses caused by this rise amounted to \$5,000 in tangible property and \$10,000 in prospective crops. Property worth about \$10,000 was saved through the use of Weather Bureau warnings.

Except for slight losses (about \$500) in the upper Smoky Hill River rise, damage from overflow along streams in the central United States upon which Weather Bureau gages are maintained was negligible. However, in Iowa (notably the southeastern quarter) and in Marathon County, Wis., between two and three million dollars damage was done to highways, bridges, and culverts by violently destructive rises in small streams—a usual result of heavy and concentrated summer-time rains.

The West Gulf Drainage floods, in most cases continuations from May, were discussed as necessary in the Review for that month, excepting the one in the Rio Grande following June 12. This rise did some slight damage to crops between the river and the levee in Cameron County, Tex.; and warnings were of considerable value in aiding levee protection work.

The Pacific Drainage floods were without important

Losses resulting from the lower Red River flood of May and June have not yet been reported.

[All dates in June unless otherwise specified]

<sup>1</sup> Continued from last month.

Improved land.

I Unimproved land.

A large percentage of the damage in Carroll County was caused by breaks in the Palucia Creek levee. One break caused the covering of 200 acres with sand a foot deep. A sand bar formed below the largest of the breaks diverted the creek water across the Greenwood-Carrollton Highway near the Carroll-LeFlore County line, destroying the highway for a distance of a mile.
